

CAREER THROUGH

Product Vision & End-to-End Career Readiness Model

Working Product Concept based on the current PRD and the proposed product flow

1. The Core Product Idea

Career Through is not simply a course platform. It is a role-specific career readiness system designed to take a person from a career goal to verified employability and real hiring opportunities.

Choose the role → Prove your current ability → Close the gaps → Build verified evidence → Prove interview readiness → Unlock jobs

2. Career Discovery

A user first enters Career Through to explore career paths, interesting jobs and opportunities. Instead of starting with a technology course, the user starts with the role they want.

- Explore roles such as Data Analyst, Frontend Developer, Backend Developer, QA Engineer and DevOps Engineer.
- See what each role does and what skills, assessments and competencies it requires.
- See relevant job opportunities and understand the readiness expected for the role.
- Choose one target career path.

The product should remain role-first: technologies, skills and topics are modules inside a career destination.

3. Paid Career Paths

Once a user chooses a career path, they can purchase access to the structured system for that role. Different roles can have different pricing because the preparation system, assessment blueprint, content, interview requirements and job mappings may differ.

Career Path	Example	Commercial Model
Data Analyst	Role-specific preparation	Role-specific price
DevOps Engineer	Role-specific preparation	Role-specific price
Frontend Developer	Role-specific preparation	Role-specific price
Backend Developer	Role-specific preparation	Role-specific price
QA Engineer	Role-specific preparation	Role-specific price

Note: exact pricing is a business decision and is not fixed by the current PRD.

4. Start With the Real Candidate

After selecting the path, the user provides their real resume/profile. The purpose is to understand their actual starting point rather than relying only on a resume optimized for ATS or a particular job application.

- Upload an existing resume or complete a structured profile.
- Parse education, projects, skills, experience, certifications and links.
- Let the user confirm or edit extracted information before it affects recommendations.
- Use the confirmed profile as the starting evidence for the target role.

5. Baseline Assessment

The system then measures the candidate across multiple dimensions. The goal is not just to test whether they can code, but to understand their overall readiness for the selected role.

Dimension	What is measured
Technical	Role-specific technical skills and practical capability
Aptitude / Logical	Numerical reasoning, logical reasoning and problem solving
Communication	Clarity, structure, fluency and other supported rubric dimensions
Soft Skills	Workplace scenarios and employability behaviors
Interview	HR, behavioral and technical interview performance

6. Role Readiness & Skills Gap Analysis

After the baseline, Career Through produces a role-specific readiness profile. The candidate can see where they currently stand, what the target role requires, what is missing and what to do next.

- Current readiness score, for example 58/100.
- Target readiness for the selected role.
- Current strengths and proficiency levels.
- Critical, important and nice-to-have skill gaps.
- Prioritized next actions.
- Explainable reasons behind the score.

The readiness engine should be a backend domain, not merely a frontend calculation. Scores should be explainable and versioned.

7. The Personalized Career System

Career Through should not behave like a generic LMS that simply gives the user a large library of content. It should tell the candidate exactly what they need to do next to become ready for their chosen role.

1. Fix foundational gaps.

2. Learn and practice role-specific skills.
3. Complete aptitude and employability practice.
4. Build role-relevant projects and evidence.
5. Complete verified assessments.
6. Practice AI mock interviews.
7. Complete human checkpoints at selected milestones.
8. Complete the final readiness and interview evaluation.

8. Evidence Before Claims

A central product principle is evidence over completion. Completing lessons should not automatically mean the candidate is considered capable. The system should accumulate evidence.

- Assessment results
- Verified / proctored attempts
- Projects and practical tasks
- Communication evaluations
- AI mock interview results
- Human-reviewed milestones
- Interview performance trends

Every material score shown to a recruiter should be traceable to evidence.

9. AI + Human Interview Readiness

AI mock interviews provide scalable repetition and feedback, while human interviews/checkpoints provide higher-value validation at important milestones.

- HR / behavioral interview practice
- Role-specific technical interviews
- AI-generated interview questions within a controlled rubric
- Communication feedback where consent and technical/legal conditions allow
- Human evaluation at selected milestones
- A common rubric across AI and human evaluation

AI should assist the process rather than become an unquestionable hiring authority.

10. Final Assessment → Career Card

After the candidate has completed the required preparation, evidence and final assessments, they receive a Career Card / Skill Passport that summarizes verified readiness.

The Career Card is the visible proof of the evidence accumulated throughout the journey.

- Target role
- Overall Career Readiness score
- Role-specific technical skills
- Aptitude, communication and interview attributes
- Verified assessments
- Verified projects / evidence
- Human-reviewed milestones
- Last verified date / evidence freshness
- Ready / Developing / Not yet ready status
- Public shareable profile with visibility controls

11. Progressive Job Unlocking

This is a key part of the proposed product model: jobs become available based on demonstrated readiness.

Example: at 60% role readiness, eligible entry-level opportunities can become visible.

However, 60% should not be treated as a universal truth across every role. Job access should use role-specific thresholds and hard requirements.

Readiness	Candidate State	Possible Access
0–39%	Foundation	Preparation only
40–59%	Developing	Continue closing critical gaps
60–69%	Entry-ready	Eligible entry-level opportunities
70–79%	Strong	Broader role opportunities
80%+	Highly ready	High-readiness opportunities, subject to job requirements

Actual thresholds should be calibrated using job descriptions, expert review, assessment data and placement outcomes.

12. Recruiter Experience

The recruiter sees evidence instead of relying only on self-reported resumes.

9. Recruiter creates a job.
10. Selects the role and requirements.
11. Requirements are mapped to the Career Through taxonomy.
12. Candidates are matched using deterministic eligibility and evidence.
13. Recruiter opens the candidate's Career Card.
14. Recruiter inspects evidence and score explanations.
15. Recruiter filters, compares and shortlists.

16. Candidate is invited to interview.
17. Hiring outcome is tracked.

13. The Complete Product Loop

18. Discover career paths
19. Choose target role
20. Purchase role-specific career path
21. Upload real resume / profile
22. Baseline assessment
23. Role readiness score
24. Skills gap analysis
25. Personalized career plan
26. Learn + practice
27. Projects + evidence
28. Verified assessments
29. AI + human interviews
30. Final assessment
31. Career Card / Skill Passport
32. Readiness-based job unlocking
33. Job matching
34. Recruiter shortlist
35. Interview
36. Hiring outcome

14. What Career Through Is Actually Selling

Not: a collection of courses. Instead: a measurable system for becoming employable for a specific role.

The deeper product assets are the role taxonomy, readiness engine, assessment system, evidence model, Career Card and recruiter matching layer. Content supports the system but is not the entire product.

15. Recommended Product Positioning

Career Through turns a career goal into verified employability.

Alternative positioning: “Choose the role. Prove you're ready. Get access to opportunities.”

The strongest differentiation is the continuous connection between career choice, assessment, skill gaps, preparation, evidence, verification, readiness and hiring.

16. Important Product Guardrails

- Do not promise that assessments are completely fool-proof; describe them as verified, tamper-resistant and auditable.
- Do not make AI the sole judge of employability or hiring eligibility.
- Keep hard job eligibility deterministic and explainable.
- Use human review at meaningful milestones.
- Give candidates visibility and consent controls for recruiter/public access.
- Version assessments and readiness formulas so historical results remain reproducible.
- Calibrate role thresholds using real job descriptions, expert review and actual placement outcomes.
- Start with a small number of complete role tracks before expanding the platform.

17. MVP Direction

The current PRD recommends proving the concept with one complete vertical slice first, then expanding to three roles.

37. Foundation: lock role taxonomy, readiness model, assessment blueprint, privacy model and design system.

38. Vertical slice: build one complete role from onboarding → assessment → roadmap → readiness → Career Card.

39. MVP: expand to three roles and add practice, aptitude, soft skills, AI mock interviews, resume intake, jobs and recruiter shortlist.

40. College pilot: test with a real student cohort and add cohort/TPO workflows.

41. Employer pilot: validate recruiter matching, Career Cards, shortlisting and interview workflow.

18. Success Metrics

- Role selection → baseline completion
- Baseline → first meaningful action
- Skill-gap completion
- Assessment pass rate
- Verified assessment completion
- Readiness improvement per student
- Mock interview improvement
- Career Card share / view rate
- Recruiter shortlist rate
- Application → interview conversion
- Interview → offer conversion
- Placement rate
